Jimm,

Thanks for getting back to me.

I may be able to pull it off myself although I welcome your input:

http://support.godaddy.com/help/article/6031/mapping-your-domain-name-to-work-with-google-sites?pc_split_value=4

It sounds straight-forward; is it?

Here's the new site:

https://sites.google.com/a/pdx.edu/landis-ii/

Cheers,

Rob

Jimm,

The recent outage has prompted me to put web site migration on the front burner. Would you have time in the next few weeks to give me some pointers how the URL is transferred from one site to another? It could be as easy as going into GoDaddy and pushing buttons but I have NO idea.

I've been using Google Sites for my lab platform and I'm excited about migrating landis-ii.org. There are many great features, particularly around giving permissions to individual pages: an opportunity to further empower our developers!

Thanks,
R
